CS Issues

1. BGMG results and scaling -- Jin Chen
2. LBL Report

Testing BGMG preconditioner on hard-to-run stellarator cases.

- In stellarator geometry, 5 (velocity) is the difficult solve.
- Without BGMG, the QH case does not run (5 diverges at first step).
- With BGMG preconditioning on 5 (nplanes=64):

Best performance when: $\text{rtol} \rightarrow 0$ (10^{-11} compared to 10^{-9} or 10^{-10}) and $\text{GMRES_restart}=100$.

- Decreasing rtol doesn't significantly increase solve time but reduces variation in iterations.
- This suggests that for these problems, a very good initial guess (coarse solution) is required to maximize efficacy of preconditioner on the full matrix.
